Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- permanent accession numbers. The new UniProt record may not contain the previous temporary numbers from the most recent version of UniProt. These sequences have been assigned new Please note that the curators of the UniProt database have purged some temporary accession accession number.
- extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein If you encounter an accession number from an older search run against UniProt (results file Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

members of the public who may encounter UniProt temporary accession When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or numbers This Page Blank (uspic,

sequence search

Hi! I'd like to request a sequence search for case 10/620,642:

- 1. the amino acid sequence of SEQ ID NO: 46
- 2. the amino acid sequence of SEQ ID NO: 61
- 3. the amino acid sequence of SEQ ID NO: 63

Thanks!

Bridget Bunner

ö
    AAR83997 is human stem cell factor (SCF). Non-naturally occuring SCF and C-terminally truncated polypeptides stimualte growth of primitive progenitors such as haematopoletic progenitor cells, neural stem cells and primordial germ stem cells. The peptides can be used in a composition for treating leucopenia, anaemia or thrombocytopenia, for enhancing engraftment of bone marrow during transplantation or for bone marrow recovery after chemotherapy or radiation-induced bone marrow aplasia or myelosuppression. They can also be used for the treating neoplasia, nerve damage, infertility, intestinal damage or myelopoliferative disorders. Autibodies may be raised against the peptides for use in detection or neutralisation of SCF in serum. SCF may be useful for the treatment of AIDS and severe combined immunodeficiency (SCID) states alone or in combination with other factors such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                KDLKKSFKSPEPRLFTPEEFFRIFNRSIDAPKDFVVASETSDCVVSSTLSPEKDSRVSVT 180

A DNA sequence (AAT29489) codes for human stem cell factor (SCF) (AAR95175). The full-length SCF transcript consists of 8 exons. A novel splice variant has been identified that appears to arise from the inclusion of a novel exon (see also AAT29488) between exons 3 and 4 of the gene. The resulting frameshift produces a novel SCF consisting of the first 39 amino acids of mature SCF followed by a 33-amino acids Cterminal region (AAR95174). The novel SCF is useful for ensuring correct development of pre-implantation embryos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 MDVLPSHCWISEMVVQLSDSLTDLLDKFSNISEGLSNYSIIDKLVNIVDDLVECVKENSS 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     a
                                                                                                                                                     Amethod has been developed of making haematopoietic cells suitable for administration to a subject. The method comprises: (a) obtaining the method comprises: (b) obtaining the cells haematopoietic progenitor cells from a donor; and (b) expanding the cells by adding to the cells a haematopoietically effective dose of a confirmation and one or more of the biological properties of naturally confirmation and one or more of the biological properties of naturally confirmation and one or more of the biological properties of naturally confirmation and one capable of maturing early haematopoietic progenitor cells including early haematopoietic progenitor cells which are capable of maturing to erythroid, megakaryocyte, can macrophage cells. SCF results in absolute increases in haematopoietic cells of both myeloid and lymphoid lineages. SCF is useful for treating haematopoietic disorders. The method is useful conformation bene matrow transplant. SCF is useful for enhancing the cefficiency of gene therapy based on transfecting haematopoietic stem cefficiency of gene therapy based on transfecting haematopoietic stem cefficiency of gene therapy based on transfecting haematopoietic recovery after acute bhood loss and as a boost to the immune system for fighting neoplasia (cancer). The present sequence represents a specifically confident human SCF from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for enhancing (B) the efficiency of transfer of a polymucleotide (I) into a target mammalian cell (II) in vitro, comprising exposing (II) that expresses a stem cell factor (SCF) receptor to a biologically active SCF, its analogue or fragment, which induces cell proliferation, and introducing (I) to (II) in vitro. Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polymucleotide into a target mammalian cell in vitro. The method is useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to AAB98350 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents human SCF (stem cell factor) protein encoded by SCF cDNA. The present invention relates to novel stem cell factors (AAU02453-AAU02460, AAU02461) and the polymucleotides conceding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF haematopoietic progenitor cells. The invention also describes SCF consed in the isolation of human and rat SCF sequences. The polymucleotide cenceding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive fungus disease, Pulminating septicemia, military tuberculosis, disseminated fungus disease, Fulminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

The present invention provides the protein and coding sequences of mammalian stem cell factors (SCFS). These are capable of stimulating the growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment of leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal naemajubinuria, malaria, pigmentation disorders, neurological and intestinal damage, infertility, ALDS and severe combined immunodeficiency (SCID). The present sequence is an SCF described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MKKTQTWILTCIYLQLILFNPLVKTEGICRNRVTNNVKDVTKLVANLPKDYMITLKYVPG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents human SCF (stem cell factor) protein encoded by SCF cDNA. The present invention relates to novel stem cell factors (AAB73561-AAB73568, AAB73571-AAB73576) and the polymucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAB73578-AAB73597) and the oligonucleotides (AAB73595-AAB73959) used in the isolation of human and rat SCF sequences. The polymucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New stem cell factor polypeptides and their analogs which stimulate growth of early hematopoietic progenitors, useful for treating aplastic anemia, carcinoma, multiple myeloma, vitiligo, kala azar, Hodgkin's
            Human, stem cell factor; SCF; early haematopoietic progenitor cell;
blood disorder; leukaemia; Hodgkin's disease; lymphoma; splenomegaly;
anaemia; Kala azar; septicaemia; malaria; hypopigmentation disorder.
                                                                                                                                                                                                                                                                                                    Human SCF (stem cell factor) protein #2, encoded by SCF cDNA.

                    encoded by SCF control of the present invention relates to novel from cell factors (AANU02761, AANU02775, AANU02797) and the polynucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AANU02777-AANU02794) and the oligonucleotides of producing sCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, disseminated fungus disease, Pulminating septicemia, malaria, vitamin B12 and folic acid deficiancy, pyridoxine deficiency, and hypopigmentation disorders such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                                                                                                                                               180

The sequence is described in an invention relating to novel stem cell factors, the polymoleotides encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosaclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, carcinoma, Gauchers disease, Niemann-Pick disease, refractory anaemia, malaria, vitamin Bl2 and folic acid deficiency, hypopigmentation disorders i.e. piebaldism and viral induced disorders, including AlDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Increasing the number of early hematopoietic progenitor cells in the peripheral blood useful for the treatment of blood disorders including Hodgkin's disease comprises the administration of human stem cell factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 MDVLPSHCWISEMVVQLSDSLTDLLDKFSNISEGLSNYSIIDKLVNIVDDLVECVKENSS 120

The present invention relates to novel non-naturally-occurring stem cell factor (SCF) polypeptides having an amino acid sequence sufficiently comparative of that of naturally-occurring SCF to allow possession of haematopoietic biological activity of naturally occurring SCF. Sequences of the invention are useful for treating leucopaenia, thrombocytopaenia, anaemia and for enhancing bone marrow recovery in treatment of radiation, engraftment of bone marrow during transplantation in mammals and chemical or chemotherapeutic induced bone marrow aplasia or myelosuppression. They are also useful for treating acquired immune deficiency in a human, nerve damage, neoplasia, infertility, myeloproliferative disorder, intestinal chamage in a mammal. SCF sequences are useful for preparing biologically active polymer polypeptide adduct, for enhancing transfer of a gene into a mammal. They are useful for treating myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, catecopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, costeopetrosis, se disease, lymphoma, dalseaminated fungus disease, nalaria, military tuberculosis, Pulminating septicaemia, pyridoxine deficiency, vitamin B12 and folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation of an disorders such as piebaldism, halds (armune deficiency syndrome) and sitting and military of disorders such as piebaldism, and prantic connection of an active propertices and folic acid deficiency, Diamond Blackfan anaemia, connections and military of humances.
acquired immune deficiency syndrome; malaria; military tuberculosis; pyridoxine deficiency; vitamin B12 deficiency; folic acid deficiency; Diamond Blackfan anaemia; hypopigmentation disorder; vitiligo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel non-naturally-occurring stem cell factor polypeptide, useful treating leucopenia, thrombocytopenia, anemia and for enhancing engraftment of bone marrow during transplantation in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present sequence is human SCF protein

```
polymicleotide sequences encoding the SCFs, and methods of producing polymicleotide sequences encoding the SCFs, and methods of producing them. SCFs are involved in the blood-forming (haematopoietic) system in mammals, particularly humans. The method of the invention is useful for the production of human SCF. The stem cell factors are useful to treat disorders involving blood cells e.g. metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus disease, malaria, and vitiligo. The present sequence represents human SCF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to novel grem cell factors (SCFs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Production of a human stem cell factor (SCF) polypeptide for disorders involving blood cells, such as leukemia, comprises mammalian cells comprising non-human SCF promoter DNA linked encoding the human SCF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length 208;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
immune deficiency, neoplasia, nerve damage, osteoporosis, metastatic carcinoma, leukaemia and miliary tuberculosis. The SCF polypeptides are also used to expand haematopoietic progenitor cells for transplantation and to prepare such cells for transfection with a gene. The SCF polynucleotides can be used for recombinant expression of the polypeptides and also as probes for mapping of the SCF gene, for identifying SCF-related diseases and as a marker for neighbouring genes. Antibodies raised against the polypeptides are useful in diagnosis and to remove SCF from blood. This sequence represents an SCF polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

The invention relates to preparing a (vertebrate) human stem cell factor (SCF) polypeptide comprising growing host cells transformed or transfected with DNA encoding a human SCF that stimulates growth of haematopoietic progenitor cells under nutrient conditions, the DNA being operatively linked to an expression control sequence, and isolating the polypeptide produced. Also included is a recombinant host cell transformed or transfected with an expression control sequence, and isolating the polypeptide produced. Also included is a recombinant host cell comprising a vertebrate SCF polypeptide in the host cell. Disclosed as new are rat and human nuclet acids encoding SCF, SCF proteins from a number of other mammals and recombinantly expressed SCF protein fragments. The DNA mammals and recombinantly expressed SCF protein fragments. The DNA mammals and recombinant techniques or for generating new and useful variety of recombinant techniques or for generating new and useful variety of recombinant techniques or for generating new and useful cransfected prokaryotic and enkaryotic host cells, and new and useful methods for cultured growth of such host cells, and new and useful methods for cultured products. The DNA sequences are also useful as labelled probes in isolating human genomic DNA encoding SCF, in methods of production of SCF and SCF products are also useful as labelled probes in isolating human genetic therapy in humans and other mammals, and coperatively probes in solating human genetic therapy in humans and other mammals, and section in developing transgenic mammalian pecies which may serve as eukaryotic posterial sprinkesis. In genetic therapy in humans and other mammals, and assert of production of SCF and SCF products in quantity. The SCF is useful accordance and disease, lymphom, carefulom, vitamin but also useful for treating hematopoletic discoders, in genetic for production of scenario and place and as general carefular and propopiementation from irradiation or chemotherapy, and AIDS. SCF is also usefu
                                                                                                                                                                                                                                                                                                                                       Preparing a human stem cell factor (SCF) polypeptide, useful for treating hematopoietic disorders, e.g., aplastic anemia, comprises growing host cells transformed or transfected with DNA encoding a human SCF.
                                                                                                                                                                                                                                   Martin FH;

occurring SCF having an amino acid sequence sufficiently duplicative of
that of naturally occurring SCF to allow possession of a haematopoietic
biological activity of naturally occurring stem cell factor, or naturally
occurring SCF. Also included are an isolated DNA sequence for use in
securing expression in a prokaryotic or eukaryotic host cell of non-
naturally occurring SCF, a prokaryotic or eukaryotic host cell
                                                                                                                                                                                                                                                                                                                                                                                           myeloproliferative disorder; early haematopoietic progenitor cell; haematopoictic disorders; aplastic anaemia; myelofibrosis; miner myelosclerosis; osteopetrosis; metastatic carcinoma; multiple myeloma; Hodgkin's disease; lymphoma; Gaucher's disease; Niemann-Pick disease;

transformed or transfected with the DNA, a polypeptide product of the expression of the DNA in a prokaryotic or eukaryotic host cell, an isolated DNA sequence coding for prokaryotic or eukaryotic host expression of non-naturally occurring SCF, a DNA sequence coding for a cypression of non-naturally occurring SCF, a DNA sequence coding for a polypeptide analogue of naturally-occurring stem cell factor, a biologically functional plasmid or viral DNA vector including the DNA sequence above, a prokaryotic or eukaryotic host cell factor, a biologically functional plasmid or viral DNA vector including the DNA sequence encoded by composite nucleic acid sequence atably transformed or transfected with the DNA, buman SCF CDNA obtained from #10.00 fibrosarcoma cell line or human SCF CDNA obtained from #10.00 fibrosarcoma cell line (and having one or more of in vitro biological carcinoma cell line, or human SCF CDNA obtained from #10.00 fibrosarcoma cell line (and having one or more of in vitro biological carcinoma cell line (and having one or more of in vitro biological carcinoma cell line (and having one or more of in vitro biological carcinoma cell line (and having one or more of in vitro biological carcinoma cell vitro biological carcinoma cell line (and having one or more of in vitro biological carcinoma cell vitrospecially occurring stem cell factor, and an antibody (Ab) specifically binding SCF. SCF. SCF is useful encoded transplantation in a mammal. SCF is useful for treating partients with therapeutically effective doses of SCF. SCF is useful for transfecting early haematopolitic progenitor cells with a gene to mammal which involves culturing early haematopoletic progenitor cells with a gene cultured cells with a gene. SCF is useful for transfecting the cultured cells with a gene. SCF is useful for transfecting the cultured cells with a gene. SCF is useful for transfecting the cultured cells with a gene. SCF is useful for transfecting agene to a mammal which involves culturing early haematopoletic progenitor cells

The present invention relates to a method (MI) for stimulating proliferation of melanocyte cells in a human. (MI) involves administering a Stem Cell Factor (SCF) protein, or its biologically active fragments that stimulates growth of melanocyte cells, and optionally a carrier, to the tsimulates growth of melanocyte cells, and optionally a carrier, to the human. The SCF is covalently conjugated to a water soluble polymer compensation of the script is covalently conjugated to a water soluble polymer of the more operations and proposition of the script is covalently conjugated to a water soluble polymer compensation and searly hematopoidetic progenitor cells that are capable of maturing to erythroid, megakaryocyte, granulocyte, are capable of maturing to erythroid, megakaryocyte, granulocyte, crimma macrophage cells, and non-hematopoidetic stem cells such as neural stem cells and primordial germ stem cells. (MI) is useful in accelerating bone marrow regeneration, and in augmenting T cell accelerating bone marrow regeneration, and in augmenting T cell accelerating bone marrow regeneration, and in augmenting T cell accelerating bone marrows regeneration, and in engandary are characterized by a reduction in functional marrow mass due to toxic, radiant or immunological injury. (MI) is useful in treating AlbS, aplacterized by a reduction in functional marrow mass due to toxic, radiant or immunological injury. (MI) is useful in treating Albacase, nultiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease, congestive splenomegaly, Kalazar, sarcoidosis, primary complexical disease, in disease, lymphoma, Gaucher's disease, intestinal damage resulting from irradiation or chemotherapy, and stem cell myeloproliferative disorders such as chronic myelogenous leukemia, configured in a syngeneic, allogeneic or autologous configured in earrow transplantation, and in enhancing the efficacy of gene configured and accelerate the invention. Claim 2; SEQ ID NO 46; 212pp; English.

mast cell growth factor - mouse

NyAlternate names: hematopoietic growth factor KL; ligand steel factor; stem cell factor

C;Species Mus musculus (house mouse)

C;Decies Mus musculus (house mouse)

C;Date: 28-Oct-1996 #sequence revision 27-Feb-1997 #text change 09-Jul-2004

C;Accession: S65801; A43751; A35976; A35972; A35975; A35973; I48768

R;Bedell, M.A.; Copeland, N.G.; Jenkins, N.A.

Genetics 142, 927-934, 1996

A;Title: Multiple pathways for Steel regulation suggested by genomic and sequence analy.

A;Reference number: S65801; MUID:97002551; PMID:8849898
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A;Molecule type: mRNA

MUCLECTIDE SEQUENCE (ISOPORMS 1 AND 2).

MEDLINE=97069946; PubMed=8912926;

Dunham S.P., Onions D.E.;

The cloning and sequencing of cDNAs encoding two isoforms of feline stem cell factor.";

DNA Seq. 6:233-237(1996).

-I- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).

-I- SUBGNIT: Homodimer, non-covalently linked (Probable).

-I- SUBCELLULAR LOCATION: Type I membrane protein (isoforms 1 and 2).

Also exists as a secreted soluble form (isoform 1 only) (By

T. A primary Harry Hundle Comparative gene map.";
T. A primary Hundle Comparative gene map.";
Submitted (JAN-2000) to the BYBL/GenBank/DBB databases.
C.-I. FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).
C.-I. SUBGNIT: Homodimer, non-covalently linked (Probable).
C.-I. SUBCELLULAR LOCATION: Type I membrane protein. Also exists as a secreted soluble form (By similarity).
C.-I. SUBCELLULAR LOCATION: Type I membrane protein. Also exists as a secreted soluble form is produced by proteolytic processing of the extracellular domain (By similarity).
C.-I. SIMILARITY: Belongs to the SCF family.
                                SCF HORSE STANDARD; PRT; 274 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CYTOKINE 11:249-256 (1999).

-!- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein. Also exists as a secreted soluble form (By similarity).
-!- PTM: A soluble form (By similarity).
-!- PTM: A soluble form (By similarity).

Seitz J.J., Schmutz S.M., Thue T.D., Buchanan F.C.;

The missense mutation in the bovine MGF gene is associated with the roan phenotype in Belgian Blue and Shorthorn cattle.";

Mamm. Genome 10:710-712(1999).

-I- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).

-I- SUBGELLULAR LOCATION: Type I membrane protein (isoforms 1 and 2): Also exists as a secreted soluble form (isoform 1 only) (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          οĘ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        POLYMORPHISM: The roan locus is responsible for the coat coloration of Belgian Blue and Shorthorn cattle. The solid-colored and white animals are homozygotes, and the roan animals, with intermingled colored and white hairs, are heterozygous. The roan phenotype is due to the Asp-218 mutation. SIMILARITY: Belongs to the SCF family.
                                                                                                                                                                                                                                                                   Kit ligand.

Acts in the early stages of hematopolesis. PTM: A soluble form is produced by proteolytic processing of the extracellular domain (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                        Schmutz S.M., Berryere T.G.;
"MGF sequencing in the dog aids in mapping to CFAIS.";
"MGF sequencing in the dog aids in mapping to CFAIS.";
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoletic progenitors in bone marrow culture. Mediates also cell-cell adhesion: Acts synergistically with other cytokines,

Able to augment the proliferation of both mysloid and lymphoid hematopoletic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synexgistically with other cytokines,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          STRAIN=Buffalo; TISSUE=Liver;

                                                                                                                                                                                                                                                                                                                                                                                                        Bennett R.D., Murphy B.D.;

Submitted (NOV-2000) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins (By similarity).

-!- SUBCURIT. Homodimer, non-covalently linked (Probable).

-!- SUBCELLUIAR LOCATION: Type I membrane protein. Also exists as a secreted soluble form (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (in

                                                                                                                                                                                                    -1- FUNCTION: Stimulates the proliferation of mast cells. Able to augment the proliferation of both myeloid and lymphoid hematopoietic progenitors in bone marrow culture. Mediates also cell-cell adhesion. Acts synergistically with other cytokines, probably interleukins.
--- SUBUNIT: Homodimer, non-covalently linked (Probable).
--- SUBCELULIAR LOCATION: Type I membrane protein (1soforms 1 and 2).
Also exists as a secreted soluble form (isoform 1 only) (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Event=Alternative splicing, Named isoforms=2;

Name=2; Synonyms=KL-2;
Isold=P20826-2; Sequence=VSP 006023;
-!- DEVELOPMENTAL STAGE: Acts in the early stages of hematopoiesis.
-!- PTM: A soluble form is produced by proteolytic processing of isoform 1 in the extracellular domain.
-!- SIMILARITY: Belongs to the SCF family.
PARTIAL PROTEIN SEQUENCE OF 26-78.

                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       333
